subunits where one of the subunits has one or more mutations, an altered surface feature or an amino acid substitution or internal deletion, extracellular domains of the integrin beta subunit that comprise a mutation that alters a non-oysteine residue to cysteine or extracellular domains of integrin alpha and beta subunits. The polypoptide of the invention demonstrates antipsoriatic, thrombolytic, anticoagulant, osteopathic cytostatic, immunospresses, antifilamatory, neuroprotective and antisickling activities and may be useful for immunotherapy in order to prevent or treat an integrin-mediated disorder such as an inflammatory disorder, an autoimmune disorder, thrombosis, cancer, osteoporosis, sickle cell anaemia, psoriasis and multiple sclerosis. The current sequence is that of the human integrin alpham subunit precursor protein of the invention.

                                                    The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The method are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 CPQEDSDIAFLIDGSGSIIPHDFRRMKEFVSTVMEQLKKSKTLFSLMQYSEEFRIHFTFK

This sequence represents a human beta-integrin CD11b subunit which is used to describe a method for identifying compounds that modulate the interaction of the beta-integrin alpha-d subunit with a binding partner of alpha-d which involves contacting an alpha-d polypeptide with an alpha-d binding partner, one of which is immobilised and the other of which is labelled, in the presence of a test compound, and determining if the compound affects binding between the alpha-d polypeptide and alpha-d binding partner, where the alpha-d polypeptide is alpha-d or its fragment comprising the cytoplasmic, transmembrane or extracellular domain of alpha-d. Compounds that modulate alpha-d binding could be used to treat diseases such as type-I diabetes, atherosclerosis, multiple sclerosis, asthma, psoriasis, lung inflammation, acute respiratory distress syndrome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mac-1 alpha subunit is involved in the response to inflammation, i.e. recognition of and migration to sites of inflammation. It also attaches to cellular substrates as part of this function making it useful in visualising endothelial tissue. Mac-1 is a member of the Integrin Gene superfamily. Integrins are a class of membrane-associated molecules that participate in cellular adhesion. Integrins are made up of an alpha subunit and a beta subunit. One class of human integrins are restricted to expression in white blood cells and have a common beta2 subunit: the leukocyte have an important role in immune and inflammatory responses. The present protein sequence is the human integrin alpha subunit CD11b. This sequence was used in an alignment to identify a novel beta2 integrin alpha subunit alpha d (AnAboul and AnBo71s9). The present sequence has approximately 60% identity to the protein sequence of alpha d. The Alpha_d gene and protein may be useful in therapy for diseases linked to aberrant alpha d function e.g. Type I diabetes, atherosclerosis, multiple sclerosis, aethma, psoriasis, lung inflammation, acute respiratory distress syndrome, rheumatoid arthritis and leukocyte adhesion deficiency (LAD). In addition, anti-alpha d monoclonal antibodies can also be used to detect and system injury. The monoclonal antibodies can also be used to detect and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of novel anti-alpha integrin d monoclonal antibodies to inhibit macrophage infiltration and reduce inflammation at central nervous system

This invention relates to a modified integrin-I or integrin I-like domain polypeptide comprising at least one disulfide bond so that the domain is stabilised in a desired conformation. The polypeptide of the invention may have antiinflammatory or immunosuppressive activities. The polypeptides of the invention have an open conformation and are useful as immunogens to produce antibodies that selectively bind to integrin I-domain, and for identifying a modulator of integrin activity, or of interaction of an integrin and a cognate ligand. The polypeptide of the invention, or antibodies (preferably anti-IFA-I antibody) is useful for tratering or preventing an integrin mediated disorder which is an inflammatory or autoimmune disorder in a subject and for inhibiting the

binding of an integrin to a cognate ligand such as Crohn's disease, nephritis; human immunodeficiency virus (HIV), myocardial infarction, slorgen's syndrome; rheumatoid arthritis, dermatitis. A therapeutic composition comprising the peptide of the invention is useful for treating an integrin mediated disorder in a subject. The polypeptides and/or active or antigenic fragments are useful as reagents for diagnosis of integrin-mediated disorders. The present sequence represents the human polypeptides of the invention

The invention relates to promoting locomotor recovery, inhibiting autonomic and sensory dysfunction following spinal cord injury by administering autonomic and sensory dysfunction following spinal cord injury by administering an anti-alpha d (Beta2 integrin alpha2 subunit) monoclonal antibody to a spinal cord injury victim. The method also involves the use of a ligand selected from ICAM-Ro v VCAM-I (intracellular cell adhesion molecule, vascular cell adhesion molecule). The method is useful for promoting locomotor recovery, inhibiting locomotor damage, limiting locomotor impairment, or limiting autonomic and sensory dysfunction following spinal cord injury. In particular, the spinal cord injury comprises compression of the spinal cord. The antibodies are also useful for reducing inflammation at the site of a central nervous system injury. The specification also details the identification of Beta2 integrins are implicated in diseases such as LAD (leukocyte adhesion deficiency, inflammatory response, diabetes, multiple sclerosis, arthritis, graft, atherosclerosis, inflammatory bowel disease, Crohn's disease, ulcerative collitis, immune complex alveolities and leukaemia. The present sequence is a Beta2 integrin alpha subunit sequence included for comparison with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           263

The invention comprises structurally biased variant integrin inserted (I) domain proteins, wherein the alterations to the protein occur in at least two noncontinuous regions. Specifically the the variant integrin I domain proteins are structurally biased to exist in the open conformation, thereby altering the binding ability of the protein. The invention also comprises nucleic acids encoding the variant integrin I domain proteins. The integrin I domain proteins and nucleic acids encoding the variant integrin I domain proteins or suppressing integrin related inflammatory and immunological disorders (e.g. rheumatoid arthritis). The variant integrin I domain proteins and nucleic acids can also be used for treating: ischaemia/ repertusion (e.g. hypovolemic shock); infarction; cerebral shock; viral infection; and cancer The variant integrin I domain nucleic acids and infection and sense therapy, as vaccines and to screen for bloactive agents. The present amino acid sequence represents the Mac-1 alpha subunit of integrin
                                                                                                                                                   New integrin I domain protein having alteration in at least 2 noncontiguous regions and exits in an open conformation, useful for treating, preventing or suppressing inflammatory or immunological
                                                                                                                                                                                                                                                                                       Example 1; Fig 1F; 90pp; English.

The invention relates to a binding domain-immunoglobulin tusion process.

Comprising a binding domain polypeptide that is fused to an immunoglobulin hinge region polypeptide that is fused to the hinge region polypeptide that is fused to the hinge region polypeptide. The constant region polypeptide comprises: a wild-type human igdi immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues; where the mutetach human igdi immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues; where the first cysteine is not mutated; a mutated human igdi immunoglobulin hinge region polypeptide contains 2 costeine residues; where the first cysteine is not mutated; a mutated human igdi immunoglobulin hinge region polypeptide contains on more than one cysteine residues; where the mutated human igdi immunoglobulin hinge region polypeptide contains no cysteine residue; and a mutated human igdi immunoglobulin hinge region polypeptide contains no cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains on cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains on cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains cospable of at least one immunological activity comprising the contains of capable of at least one immunoglobulin hinge region polypeptide contains construct comprising the polymuclectide (operably linked to a promoter), a recombinant expression construct comprising the polymuclectide (operably linked to a promoter).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            construct, producing the binding domain-immunoglobulin fusion protein, a pharmaceutical composition comprising the binding domain-immunoglobulin fusion protein, a pharmaceutical composition comprising the binding domain-immunoglobulin fusion protein or polymucleotide and a carrier, and treating a subject having or suspected of having a malignant condition or a B-cell disorder. The binding domain-immunoglobulin fusion protein is useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, carcinoma or sarcoma, rheumatoid arthritis, mysthenia gravis, Grave's disease, type I diabetes mellitus, multiple sclerosis or autoimmune disease. The present sequence is a binding domain immunoglobulin fusion protein-associated protein sequence. Note: The sequence data for this patent formed part of the printed specification, and is also available in electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly from USPTO electronic formet directly directly electronic formet directly from USPTO electronic formet directly directly directly directly directly directly directly directly delectronic directly delectronic directly delectronic directly de
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New binding domain-immunoglobulin fusion protein, useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, Grave's disease or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  segdata uspto.gov/sequence.html?DocID=20030118592. The authors have not identified the sequences in the printed specification by their SEQ ID number therefore none of the sequences can be explicitly identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a binding domain-immunoglobulin fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ledbetter JA, Hayden-Ledbetter MS, Thompson PA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; SEQ ID NO 176; 157pp; English

The invention relates to a Factor B analogue that exhibits modified complement activity in vitro. The analogue is generated by substituting a bort compensus repeat domain (SCR) or a von Willebrand Factor domain (SCR) or a will willebrand Factor domain (WWP) of human factor B with a SCR or a wWF from a second protein such as human complement activity complement involved in immune and autoimmune responses. Complement activity can account for substantial tissue damage in a wide variety of autoimmune complex mediated syndromes auch as lupus erythematosus, can account for substantial tissue damage in a wide variety of autoimmune complement system using the analogues is likely to provide a means of the complement system using the analogues. Is likely to provide a means of the rapeutic intervention in these cases. Inhibition of complement may also be favorable in cases that involve tissue damage caused by vascular injury such as myocardial infarction, creebral vascular accidents or acute shock lung syndrome. In these cases the complement system may contribute to the destruction of partially damaged tissue as in reperfusion injury. In addition, the use of complement system may contribute to the destruction of partially damaged tissue as in the prevention of xenograft rejection (the inhibition is important in the prevention of xenograft rejection (the inhibition of complement by cell-associated and soluble inhibitors is useful in protecting the transplant from damage caused by activation of endogenous complement. The present sequence represents the vWF domain of human factor MAC-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Factor B analogue; modified; complement activity; complement factor B; short consensus repeat domain; von Willebrand Factor domain; human; C2; CR3; autoimmune response; tissue damage; lupus erythematosus; therapy; rheumatoid arthritis; hemolytic anemia; myasthemia gravis; injury; MAC-1; myocardial infarction; acute shock lung syndrome; inflammation; vWF.

CD11b alpha subunit A domain, where I at residue 332 has been replaced by G or A, F at residue 313 and A at residue 320 have been replaced by C, or seridue 315 and A at residue 320 have been replaced by C, is useful C or determining if a test compound is a candidate compound for binding to CD11b or for treating an inflammatory disorder, by contacting a test compound with the polypeptide and determining if the test compound binds or to the polypeptide. The integrin subunits are useful for reducing skeletal muscle injury, for treating disorders caused by ischaemiater reperfusion injury, immune complexes, restenosis and parasitic diseases, to purify variant integrin polypeptide ligands and as bait proteins in two-hybrid or three-hybrid assays. This sequence represents a human integrin alpha subunit CD11b variant A domain. Note: This variant sequence is not featured in the specification but has been derived from the wild-type protein shown in AAU76847 

Sequence 191 AA;

Arnaout AM, Li R, Xiong J;

The invention relates to a high affinity integrin polypeptide comprising all or part of a variant integrin alpha subunit A domain or a variant integrin beta subunit A-like domain. The polypeptide, preferably the CD11b alpha subunit A domain, where I at residue 332 has been replaced by G or A, F at residue 313 and A at residue 320 have been replaced by C, or V at residue 313 and A at residue 320 have been replaced by C, or CD1b or contracting if a test compound is a candidate compound for binding for determining if a test compound is a candidate compound for binding to the polypeptide and determining if the test compound binds to the polypeptide and determining if the test compound binds skeletal muscle injury, for treating disorders caused by ischaemia-representing injury, increating disorders caused by ischaemia-reperfusion injury, increating disorders caused by ischaemia-reperfusion injury, increating disorders and parasitic diseases, to purify variant integrin polypeptide 11qands and as bait proteins in two-hybrid or three-hybrid assays. This sequence represents the human Novel high affinity integrin polypeptide useful for treating restenosis and parasitic diseases, comprises all or part of variant integrin alpha subunit A domain or variant integrin beta subunit A-like domain. integrin alpha subunit CD11b A domain Sxample 2, Fig 5, 55pp; English. Sequence 191 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to generating a specific binding partner to a peptide, encoded by a genomic DNA fragment or an expressed sequence tag (EST). A nucleic acid molecule encoding a fusion protein is expressed in a host cell to allow the formation of inclusion bodies comprising the fusion protein, the inclusion bodies are isolated and a specific binding partner is generated. The specific binding partners generated are useful for identifying and characterizing naturally occurring proteins e.g. as immunoglobulins or fragments in immunoassays
                                      Generating specific binding partners to (poly)peptides encoded by genomic DNA fragments, involves forming inclusion bodies by expressing the (poly)peptide as part of fusion proteins.
                                                                                                                                                                                                                                                                                                  PNPRSLVKPITQLLGRTHTATGIRKVVRELFNITNGARKNAFKILVVITDGEKFGDPLGY 125

```
A fusion protein comprises a glutathione-S-transferase fusion partner, used to increase the level of soluble protein expression in B. coli and to facilitate affinity purification, and the human leukocyte beta-1 integrin Mac-1 I-domain, linked by a Factor-Xa recognition sequence that allows cleavage of the fusion protein and recovery of the I-domain, which is useful as an antiinflammatory. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                290

The invention relates to a high affinity integrin polypeptide comprising all or part of a variant integrin alpha subunit A domain or a variant integrin alpha subunit A domain or a variant integrin beta subunit A-like domain. The polypeptide, preferably the CD11b alpha subunit A domain, where I at residue 332 has been replaced by C CD11b alpha subunit A domain, where I at residue 332 has been replaced by C OT V at residue 313 and A at residue 320 have been replaced by C, or V at residue 315 and A at residue 320 have been replaced by C, is useful to for determining if a test compound is a candidate compound for binding to CD11b or for treating an inflammatory disorder, by contacting a test compound with the polypeptide and determining if the test compound binds to the polypeptide. The integrin subunits are useful for reducing to the polypeptide. The integrin polypeptide ligands and as bait proteins in two-hybrid or three-hybrid assays. This sequence represents a human integrin alpha subunit CD11b deletion variant A domain. Note: This cariant sequence is not featured in the specification but has been compared to the protein shown in AAU76847
                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel high affinity integrin polypeptide useful for treating restenosis and parasitic diseases, comprises all or part of variant integrin alpha subunit A domain or variant integrin beta subunit A-like domain.

Nighternate glycoprotein CD11b precursor [validated] - human
Nighternate names: complement receptor type 3 alpha chain; leukocyte adhesion protein Maceusocyte integrin alpha chain; neutrophil adherence receptor alphaM chain
Cispecies: Homo sapiens (man)
Cispecies: Homo sapiens (man)
Cipate: 31-Dec-1992 #sequence\_revision 31-Dec-1992 #text\_change 09-Jul-2004
Cipacession: A31.08; A28915; A41600; A30892; A32218; A46526; A26091; I52567
Cipate: 31-Dec-1992 #sequence revision 31-Dec-1992 #text\_change 09-Jul-2004

reconstructions of monocytes, macrophages and granulocytes adhesive interactions of monocytes, macrophages and granulocytes as well as in mediating the uptake of complement-coated particles.

It is identical with CR-3, the receptor for the iC3b fragment of the third complement component. It probably recognizes the R-G-D peptide in C3b. Integrin alpha-M/beta-2 is also a receptor for fibrinogen, factor X and ICAMI. It recognizes Pl and P2 peptides of fibrinogen gamma chain.

C. ISUBUNIT: Heterodimer of an alpha and a beta subunit. Alpha-M associates with beta-2.

C. ISUBCELLULAR LOCATION: Type I membrane protein.

C. INESTITE SPECIFICITY: Predominantly expressed in monocytes and

Integrins with I-domains do not undergo protease cleavage.
SIMILARITY: Belongs to the integrin alpha chain family.
SIMILARITY: Contains 7 FG-GAP repeats.
SIMILARITY: Contains I WWPA domain.

as well as in mediating the uptake of complement-coated particles. It is identical with CR-3, the receptor for the iC3b fragment of the third complement component. It probably recognizes the R-G-D peptide in C3b. Integrin alpha-M.beta-2 is also a receptor for fibrinogen, factor X and ICAM1. It recognizes Pl and P2 peptides of fibrinogen gamma chain. Alpha-M.beta-2 play a critical role in mast call development and in immune complex-mediated glomerulonephritis. Mice expressing a null mutation of the alpha-M subunit gene demonstrate increase in neutrophil accumulation, in response to a impaired degranulation and phagocytosis, events that apparently accelerate apoptosis in neutrophils. These mice develop

"Cloning of rat alpha D, a novel beta 2 integrin.";

"Cloning of rat alpha D, a novel beta 2 integrin.";

"Cloning of rat alpha D, a novel beta 2 integrin.";

"Cloning of rat alpha D, beta-2 is a receptor for ICAM3 and volumed (MQC-1997) to the EMBL/GenBank/DobU databases.

"CAM1. May play a role in the atherosclerotic process such as clearing lipoproteins from plaques and in phagocytosis of bloddborne pathogens, particulate matter, and senescent erythrocytes from the blood (By similatity).

"SUBUNIT: Heterodimer of an alpha and a beta subunit. Alpha-D associates with beta-2 (By similarity).

"SUBUNIT: Heterodimer of an alpha and a beta subunit. Alpha-D associates with beta-2 (By similarity).

"SUBUNIT: Hoterodimer of an alpha and a very domain. Integrins with 1-domains do not undergo procease cleavage.

"Integrin Belongs to the integrin alpha chain family.

"SIMILARITY: Contains 1 VWFA domain.
                                                                                                                                                                                                                                                                              61 BFQNNPNPRSLVKPITQLLGRTHTATGIRKVVRELFNITNGARKNAFKILVVITDGEKFG 120
